The chemical resistance of Trogamid T was measured by immersing test samples in the above medias for 6 months at 73° degrees F. At higher temperatures both the failure and tendency for stress fractures formation increase. If you are considering using Trogamid T at a higher temperature it is important to first check whether Trogamid would be suitable at the planned operating temperature. To test, make sure the material is a strain-free and completely surrounded by the test medium. Internal stresses which occur in finished products have an added () comment on resistance of Trogamid

G = GOOD RESISTANCE

F = FAIR RESISTANCE

SAT = SATURATED SOLUTION

CONC. = CONCENTRATED

NR = NOT RESISTANT

(1) STRESS CRACK FORMATION

(2) DISSOLVES

(3) DISCOLORATION, IMPAIRS TRANSPARENCY
